| Project Code   | Project Name                                      | Objective                                                                                                                |
|----------------|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|                |                                                   |                                                                                                                          |
| TCMAPY1296     | A Semi-Supervised Learning Approach to Quality-   | This project aims to create a semi-supervised learnin                                                                    |
|                | Based Web Service Classification (Python/Machine  | framework for classifying web services based on quality.                                                                 |
|                | Learning)                                         | utilizes both labeled and unlabeled data: labeled data guid                                                              |
|                |                                                   | classification, while unlabeled data improves generalization                                                             |
|                |                                                   | across diverse data distributions. The goal is to automate an<br>enhance the evaluation of web service quality attribute |
|                |                                                   | effectively.                                                                                                             |
|                |                                                   | enectively.                                                                                                              |
| TCMAPY1370     | Steel Surface Defect Detection                    | The primary objective of this project is to develop a                                                                    |
| 1011111070     | (Python/Machine Learning)                         | automated steel surface defect detection system the                                                                      |
|                |                                                   | accurately identifies six distinct types of defects using th                                                             |
|                |                                                   | YOLOv8 model. Specific objectives include enhancing                                                                      |
|                |                                                   | defect detection speed and precision to facilitate real-tim                                                              |
|                |                                                   | applications, reducing the dependency on manual inspection                                                               |
|                |                                                   | to improve operational efficiency, and minimizing huma                                                                   |
|                |                                                   | error in quality control processes                                                                                       |
|                |                                                   |                                                                                                                          |
| TCMAPY1430     | Unveiling Customer insights Advanced segmentation | The main objective of this Project is to create an effective                                                             |
|                | (Python/Machine Learning)                         | system for the customer segmentation and to add value to the                                                             |
|                |                                                   | organisation.                                                                                                            |
|                |                                                   |                                                                                                                          |
| TCMAPY1440     | Machine Learning Based Effective Fine Grained     | The objective of this project is to classify weather condition                                                           |
|                | Weather Forecasting Model                         | into five categories-Cloudy, Overcast, Sunny, Foggy, an                                                                  |
|                | (Python/Machine Learning)                         | Rain—using machine learning techniques for accurate an                                                                   |
|                |                                                   | efficient weather prediction.                                                                                            |
| ТСМАРУ1439     | Gynecological Disease Diagnosis Expert System     | The primary objective of the Gynecological Diseas                                                                        |
|                | GDDES Based on Machine Learning Algorithm and     | Diagnosis Expert System (GDDES) project is to develop a                                                                  |
|                | Natural Language Processing                       | advanced diagnostic tool that leverages machine learning                                                                 |
|                | (Python/Machine Learning)                         | algorithms and Natural Language Processing (NLP)                                                                         |
|                |                                                   | accurately identify and diagnose common gynecologic                                                                      |
|                |                                                   | disorders, specifically Urinary Tract Infection (UTI) and                                                                |
|                |                                                   | Polycystic Ovary Syndrome (PCOS).                                                                                        |
| TCMAAN1176     | Explainable AI for crop Recommendation, yield     | The primary objective of this project is to develop a                                                                    |
| - Strain (1170 | Forecasting and Rainfall prediction in Smart      | integrated AI-based framework that provides accurate cro                                                                 |
|                | Agriculture                                       | recommendations, yield forecasting, and rainfall prediction                                                              |
|                | (Python/Machine Learning)                         | for smart agriculture.                                                                                                   |
|                |                                                   | -                                                                                                                        |

|              | (Python/Machine Learning)                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TCMAPY1388   | A Semi-Supervised Learning Approach To Quality-<br>Based Web Service Classification<br>(Python/Machine Learning)                        | The objective of this project is to develop an intellige<br>system that classifies web services into quality categorie<br>(Bronze, Silver, Gold, Platinum) using machine learning<br>algorithms and Explainable AI (LIME). The system also<br>recommends relevant services based on key performance<br>metrics, aiming to improve service selection and decision<br>making accuracy                                                                                                        |
| TCMAPY1375   | Adaptive Monitoring For Early Stage Ransomware<br>Detection Via Behaviour And Network Traffic<br>Analysis<br>(Python/Machine Learning)  | The primary objective of this project is to develop a adaptive monitoring framework capable of detectir ransomware in its early stages through a combination of behavioral and network traffic analysis.                                                                                                                                                                                                                                                                                   |
| TCMAPY1379   | Meditaion Toxicity Forcasting Using Deep Learning<br>(Python/Machine Learning)                                                          | This project aims to develop a deep learning-based mod<br>for predicting opioid prescription toxicity by analyzing<br>dataset of 25,000 records with 256 features. Using technique<br>like RNN, Random Forest, XGBoost, and Voting Classifier<br>the goal is to identify high-risk prescribers and uncov<br>patterns linking specific medications (e.g., Acetaminophe<br>Gabapentin, Levothyroxine) to increased toxicity, ultimate<br>improving prescription safety and mitigating risks. |
| TCMAPY1384   | Carbon Emission Prediction Through the<br>Harmonization of Extreme Learning Machine and<br>INFO Algorithm.<br>(Python/Machine Learning) | Develop a predictive model for vehicle carbon emission<br>using ML techniques, enhancing accuracy through featur<br>engineering and advanced algorithms.                                                                                                                                                                                                                                                                                                                                   |
| TCMAPY1235   | A Novel Web Framework for Cervical Cancer<br>Detection System A Machine Learning Breakthrough<br>(Python/Machine Learning)              | This research introduces a novel web framework for cervic<br>cancer detection using advanced machine learnin<br>techniques. It integrates AdaBoost, XGBoost, stackin<br>classifier, and logistic regression models to improv<br>diagnostic accuracy. The objective is to enhance ear<br>detection and intervention processes, aiming to improv<br>patient outcomes in cervical cancer management.                                                                                          |
| TCMAPY1271   | Active Machine Learning For Heterogeneity Activity<br>Recognition Through Smartwatch Sensors                                            | This project aims to create an efficient activity recognition<br>system using smartwatch sensors. It leverages active<br>machine learning to classify activities like walking, running<br>biking, and standing based on accelerometer and gyroscop                                                                                                                                                                                                                                         |

|              |                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|              | (Python/Machine Learning)                                                                                                | data. By reducing labeled data needs through active learning,<br>it aims to lower labeling costs while continuously refining<br>model performance                                                                                                                                                                                                                                                                                       |
| ТСМАРҮ1224   | An Ensemble Deep Learning Model for Vehicular<br>Engine Health Prediction<br>(Python/Deep Learning)                      | This project aims to develop an ensemble deep learning<br>model combining Random Forest and KNN algorithms for<br>predictive maintenance of vehicular engines. By leveraging<br>Real-time sensor data and historical records, it seeks to<br>enhance accuracy in identifying early signs of engine<br>degradation, thus improving reliability and optimizing<br>operational efficiency in automotive engineering.                       |
| ТСМАРҮ1227   | An Advanced Approach For Detecting Behavior-<br>Based Intranet Attacks By Machine Learning<br>(Python/Machine Learning)  | The project aims to develop a sophisticated system using<br>machine learning to identify and mitigate intranet attacks. By<br>analyzing behavioral patterns and network data, it seeks to<br>detect unauthorized access, data exfiltration, and malware<br>infections. The goal is to enhance intranet security through<br>real-time detection and response capabilities, safeguarding<br>critical network assets effectively.          |
| ТСМАРУ1238   | Classifying Tor Traffic Encrypted Payload Using<br>Machine Learning<br>(Python/Machine Learning)                         | This study introduces a robust ML framework to classify<br>encrypted Tor traffic payloads for cybersecurity<br>enhancement. Using diverse features like Source Port,<br>Destination Port, and IAT, Decision Tree, Logistic<br>Regression, and XGBoost models are evaluated for<br>accurately predicting traffic nature ('label'). It aims to<br>optimize real-time encrypted traffic analysis for secure<br>network environments.       |
| TCMAPY1303   | Explainable Data Driven Digital Twins For<br>Predicting Battery States In Electric Vehicles<br>(Python/Machine Learning) | This project aims to develop an advanced predictive model<br>for electric vehicle battery states using Explainable Data-<br>Driven Digital Twins. It integrates diverse machine learning<br>algorithms (DNN, LSTM, CNN, SVR, SVM, FNN, RBF,<br>RF, XGBoost) to accurately forecast SOC and SOH.<br>Emphasis is placed on enhancing model transparency to<br>optimize EV performance and support sustainable<br>automotive technologies. |
| ТСМАРУ1326   | Hybrid Machine Learning Model For Efficient<br>Botnet Attack Detection In IOT Environment<br>(Python/Machine Learning)   | Developing a hybrid ML model for efficient botnet attack<br>detection in IoT environments. Integrates diverse ML<br>techniques to enhance detection accuracy, leveraging IoT-<br>specific data characteristics. Aimed at improving<br>cybersecurity by identifying and mitigating botnet threats<br>effectively in IoT networks.                                                                                                        |

|              |                                                                                                                                                                   | encrypted cloud data, ensuring correctness and confidentiality in healthcare contexts.                                                                                                                                                                                     |
| TCMAPY1281   | Expressive Public-Key Encryption With Keyword<br>Search: Generic Construction From KP-ABE and an<br>Efficient Scheme Over Prime-Order<br>Groups<br>(python/cloud) | This paper critically assesses the security of expressive<br>public-key encryption with keyword search (PEKS)<br>schemes, revealing a keyword guessing attack vulnerability,<br>and aims to improve resilience in cloud data privacy<br>encryption schemes.                |
| TCMAPY1281   | Improving Digital Forensic Security: A Secure<br>Storage Model With Authentication and Optimal Key<br>Generation Based Encryption<br>(python/cloud)               | This paper develops DFA-AOKGE, a secure digital forensic<br>architecture for IaaS, using decentralized storage, multikey<br>homomorphic encryption, and advanced key generation to<br>enhance evidence protection and integrity during<br>investigations.                  |
| TCMAPY1      | PEEV: Parse Encrypt Execute Verify—A Verifiable<br>Fhe Framework (python/cloud)                                                                                   | The PEEV framework enhances cloud data confidentiality<br>by enabling secure, remote computation on encrypted data<br>using homomorphic encryption and zero-knowledge proofs,<br>simplifying program writing, verification, and protecting<br>against dishonest providers. |
| TCMAPY1245   | Privacy-Preserving and Trusted Keyword Search for<br>Multi-Tenancy Cloud<br>(python/cloud)                                                                        | This study designs and implements a privacy-preserving,<br>verifiable, and accountable keyword searchable encryption<br>(VAKSE) scheme for multi-tenant clouds, ensuring secure<br>keyword searches, data privacy, and efficient parallel<br>processing.                   |
| TCMAAN1153   | Multi-Keywords Searchable Attribute-Based<br>Encryption With Verification and Attribute<br>Revocation Over Cloud Data<br>(python/cloud)                           | Develop and evaluate MKSABE-VaAR, an encryption<br>system for efficient multi-keyword searches in cloud storage,<br>using polynomial keyword combinations, user attribute<br>verification, and linear secret-sharing for enhanced security<br>and performance.             |
| TCMAAN1156   | A Pairing Free Provable Public Key Dual Receiver<br>Encryption Scheme<br>(python/cloud)                                                                           | Develop a Dual Receiver Encryption (DRE) scheme using<br>decisional Diffie-Hellman for enhanced efficiency and<br>public verifiability, offering strong security against chosen<br>ciphertext attacks and reduced computational complexity.                                |
| TCMAAN1157   | Revolutionizing Cloud Data Security with Elliptic<br>Curve Cryptography.<br>(python/cloud)                                                                        | Enhance cloud data security by implementing Elliptic Curve<br>Cryptography (ECC) to provide robust encryption with<br>lower computational and energy requirements, improving<br>efficiency and security in cloud-based systems.                                            |
